

Mobile Application Development

Segue Technologies® is actively engaged in supporting the growing need for Mobile Application development. We work closely with our customers to identify areas where mobile apps can provide new capabilities and efficiencies, augment existing web-enabled processes, or be a stand-alone product

We view Mobile Application development as a way to extend capabilities of existing systems and information stores, as well as an opportunity to develop products for devices of every size. We provide mobile development services for native applications for Android and iOS devices, and mobile web applications using HTML5 and responsive design.

We support businesses seeking to modernize their capabilities and entrepreneurs with ideas for exciting new mobile apps, with full-service support from market research, to design, development, and launch into the app store marketplace. If you have a new idea or need help extending the reach of your business to mobile users, we can help!
